Think about it - The origins of the first animals are shrouded in mystery. Since Darwin, paleontologists have known, based on fossil evidence, that many modern multicellular phyla first appeared during a ...

### **Chapter 26**

The evolution of amphibians. By the Devonian period two major animal groups dominated the land: the tetrapods (4-legged terrestrial vertebrates) and the arthropods, including arachnids and wingless insects. The first tetrapods were amphibians, such as Ichthyostega, and were closely related to a group of fish known as lobe-finned fish e.g. Eusthenopteron.

### **The Evolution of Animal Diversity - Scranton Prep Biology**

Animals are multicellular eukaryotic organisms that form the biological kingdom Animalia. With few exceptions, animals consume organic material, breathe oxygen, are able to move, can reproduce sexually, and grow from a hollow sphere of cells, the blastula, during embryonic development. Over 1.5 million living animal species have been described—of which around 1 million are insects—but it

has ...
