Crystal growth requires either (i) a reversible pathway between a fluid phase (solution, melt, or vapor) and the solid phase or (ii) high surface or bulk mobilities in the solid phase (Fig. 1) (1). These conditions allow atoms, ions, or molecules to adopt correct positions in developing crystal lattices.

Solubility. Insolubility is the inability to dissolve in a solid, liquid or gaseous solvent. Most often, the solvent is a liquid, which can be a pure substance or a mixture. One may also speak of solid solution, but rarely of solution in a gas (see vapor-liquid equilibrium instead). Under certain conditions,...

A solid solution is a solid-state solution of one or more solutes in a solvent. Such a multi-component system is considered a solution rather than a compound when the crystal structure of the solvent remains unchanged by addition of the solutes, and when the chemical components remain in a single homogeneous phase.
