I think there are also solutions out there for Apostol's Mathematical Analysis. Also, I think you asked a question about this exercise back in November? I did finally get around to updating that. I don't have anything insightful to say about the motivation for the problem, but at least the solution should now be mathematically correct (I hope).

I have an option to choose between the two books Mathematical Analysis by Tom Apostol and Principles of Mathematical Analysis by Walter Rudin as I was gifted Rudin by a friend and ended up buying the other book as well. I will be indebted if someone told me which one is the tougher one and which one is better for the self-learner (I am in high school and have no access to a professor or anyone).

Rudin's Principles of Mathematical Analysis is the one to beat in this field. Apostol's treatment is not that different from Rudin's. The books were written about the same time, with Rudin having editions in 1953, 1964, and 1976, and Apostol in 1957 and 1974. The coverage of the two books is roughly similar.

Apostol's treatment of basic topology as an extension of set theory is particularly good! Once you have a clear understanding of limits as they relate to topology then you'll finally "get" the whole delta-epsilon arguments from calculus. As an introductory text to the world of mathematical analysis I don't think this book can be beat.
