When you draw a geometric figure on a grid, each point has a pair of coordinates. Most graphics programs have methods for moving figures from one position to another. The programs move key points (like vertices of polygons) first and then automatically fill in line segments to connect the key points.

Transformations in the Coordinate Plane. In this exploration activity of reflections, translations, and rotations, students are guided to discover general algebraic rules for special classes of transformations in the coordinate plane. This lesson is intended to be used after the development of formal definitions of rotations, translations, and reflections.
